eur
FOT

Bringing intelligent vehicles to the road

Agenda

- Field Operational Test in general
- euroFOT approach
- euroFOT results

Why Field Operational Tests?

- Evaluation of ADAS normally conducted by means of
 - Test track
 - Driving simulator
 - Hardware In the Loop
 - Software In the Loop
- All these tests are conducted under controlled conditions
- Remaining question: How does the function and the driver behave under real conditions
 - These information can be provided by means of Field Operational Test

Defintion of terms

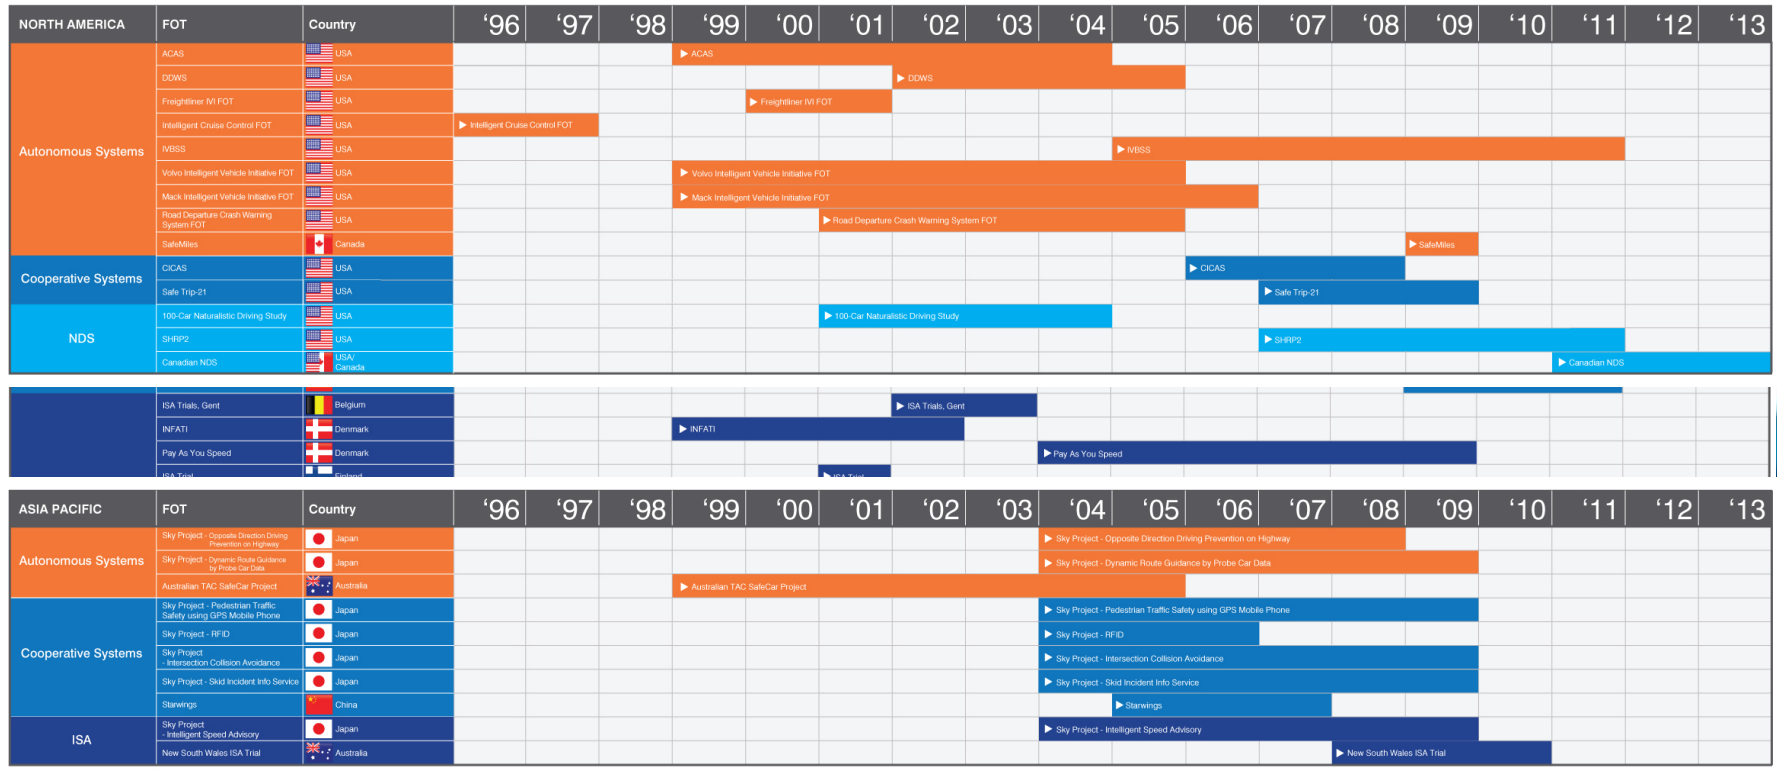

- **Field Operational Test:**
 - A Field Operational Test (FOT) is a study undertaken to evaluate a function, or functions, under normal operating conditions in environments.
- **Naturalistic driving study:**
 - Naturalistic Driving Study (NDS) refers to studies undertaken using unobtrusive observation when driving in a natural setting. Both, Naturalistic Driving Studies and Naturalistic FOTs use this type of observation. In NDS, the driver becomes unaware of the observation as the data collection is organised as discreet as possible and preferably drivers use their own vehicles.

Overview on Field Operational Tests

Source: <http://www.fot-net.eu>

Agenda

- Field Operational Test in general
- euroFOT approach
- euroFOT results

euroFOT

- First European Large-Scale Field Operational Test on In-Vehicle Systems
- Total indicative budget: 22 million €
- Total indicative funding: 14 million €
- Project duration: May 2008 - June 2012
- 28 partners from 10 different countries
- Coordinator: Aria Etemad (Ford Research & Advanced Engineering Europe)

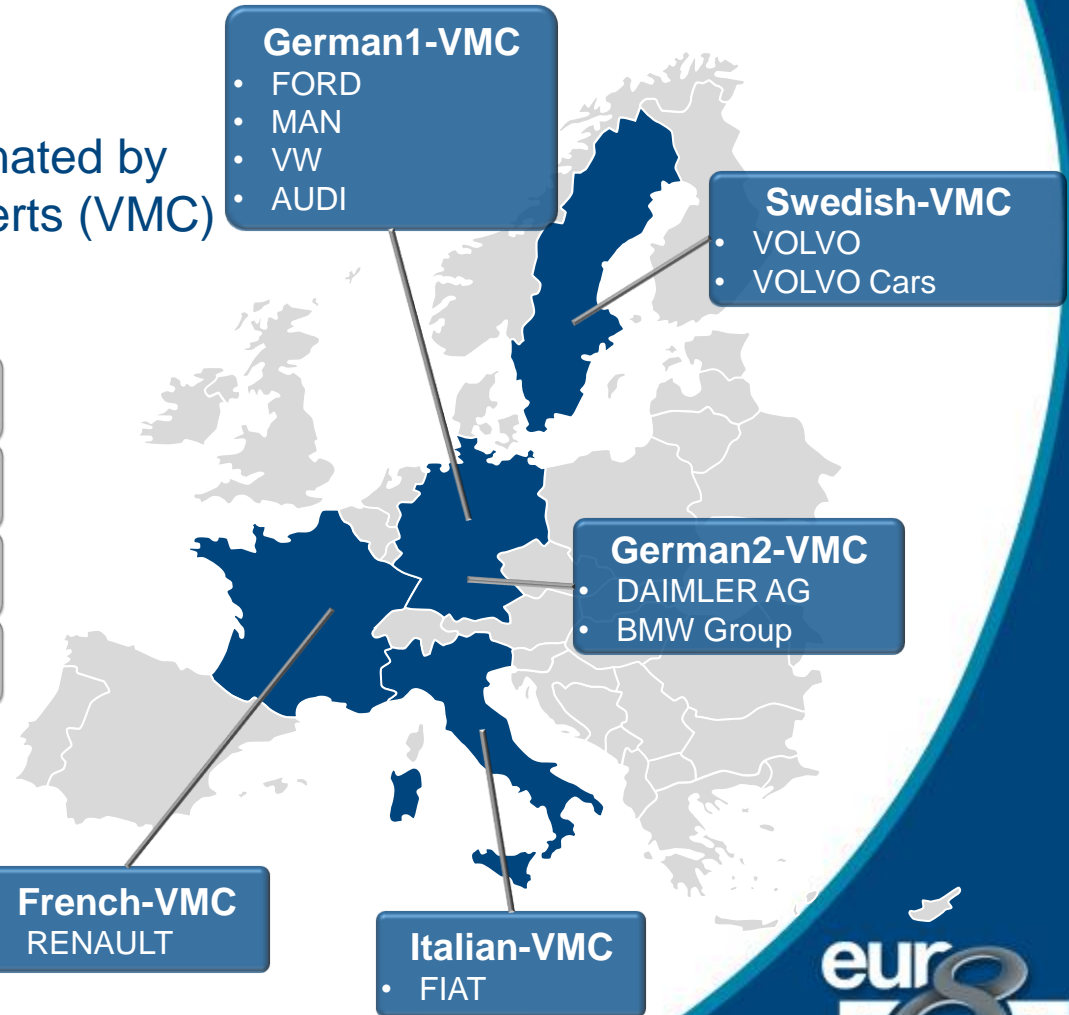

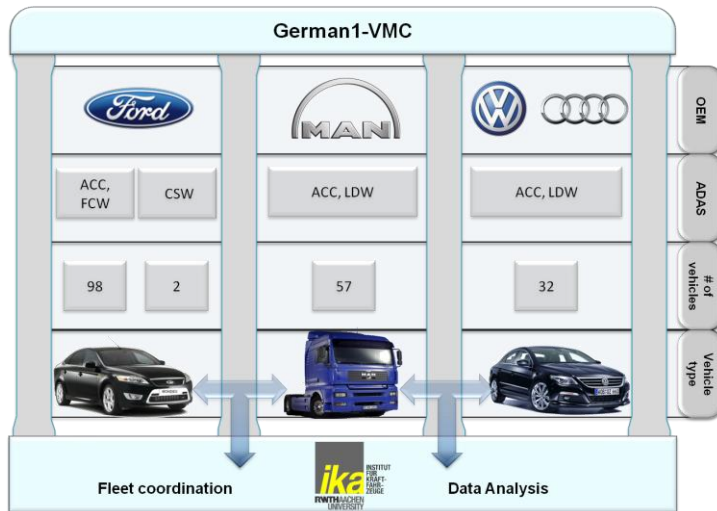

FOT status

	French VMC	German VMC Operation Centre 1				German VMC Operation Centre 2		Italian VMC	Swedish VMC	
										
Target number of vehicles	35	100	100	40	(20)	15	15	500	100	80
No. of vehicles participated FOT	35 (+5)	98 (+2)	57	32	(20)	15	15	533	100	80
No. of vehicles currently running	35 (+5)	98 (+2)	57	0	2	15	3	401	100	15
No. of involved drivers	35	130	80	32	(20)	45	60	533	204	86
FOT start date	October 2010	April 2010	January 2011	June 2010	January 2011	August 2010	February 2010	February 2010	February 2010	May 2010

972 vehicles participated with 1068 drivers

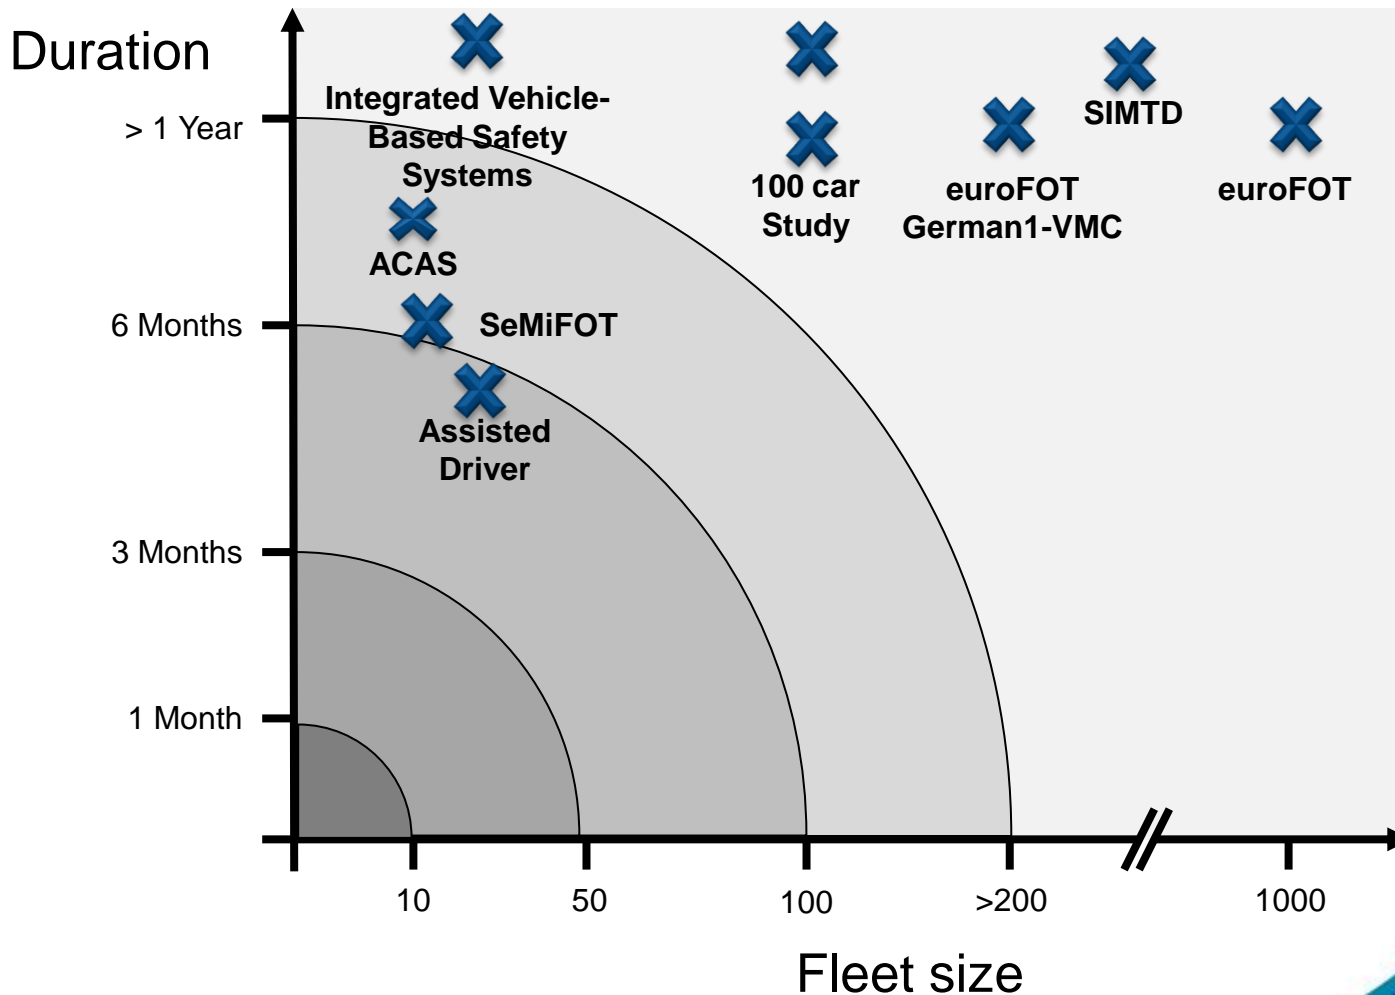

euroFOT – German1-VMC

- The euroFOT fleet were coordinated by five Vehicle Management Centers (VMC)

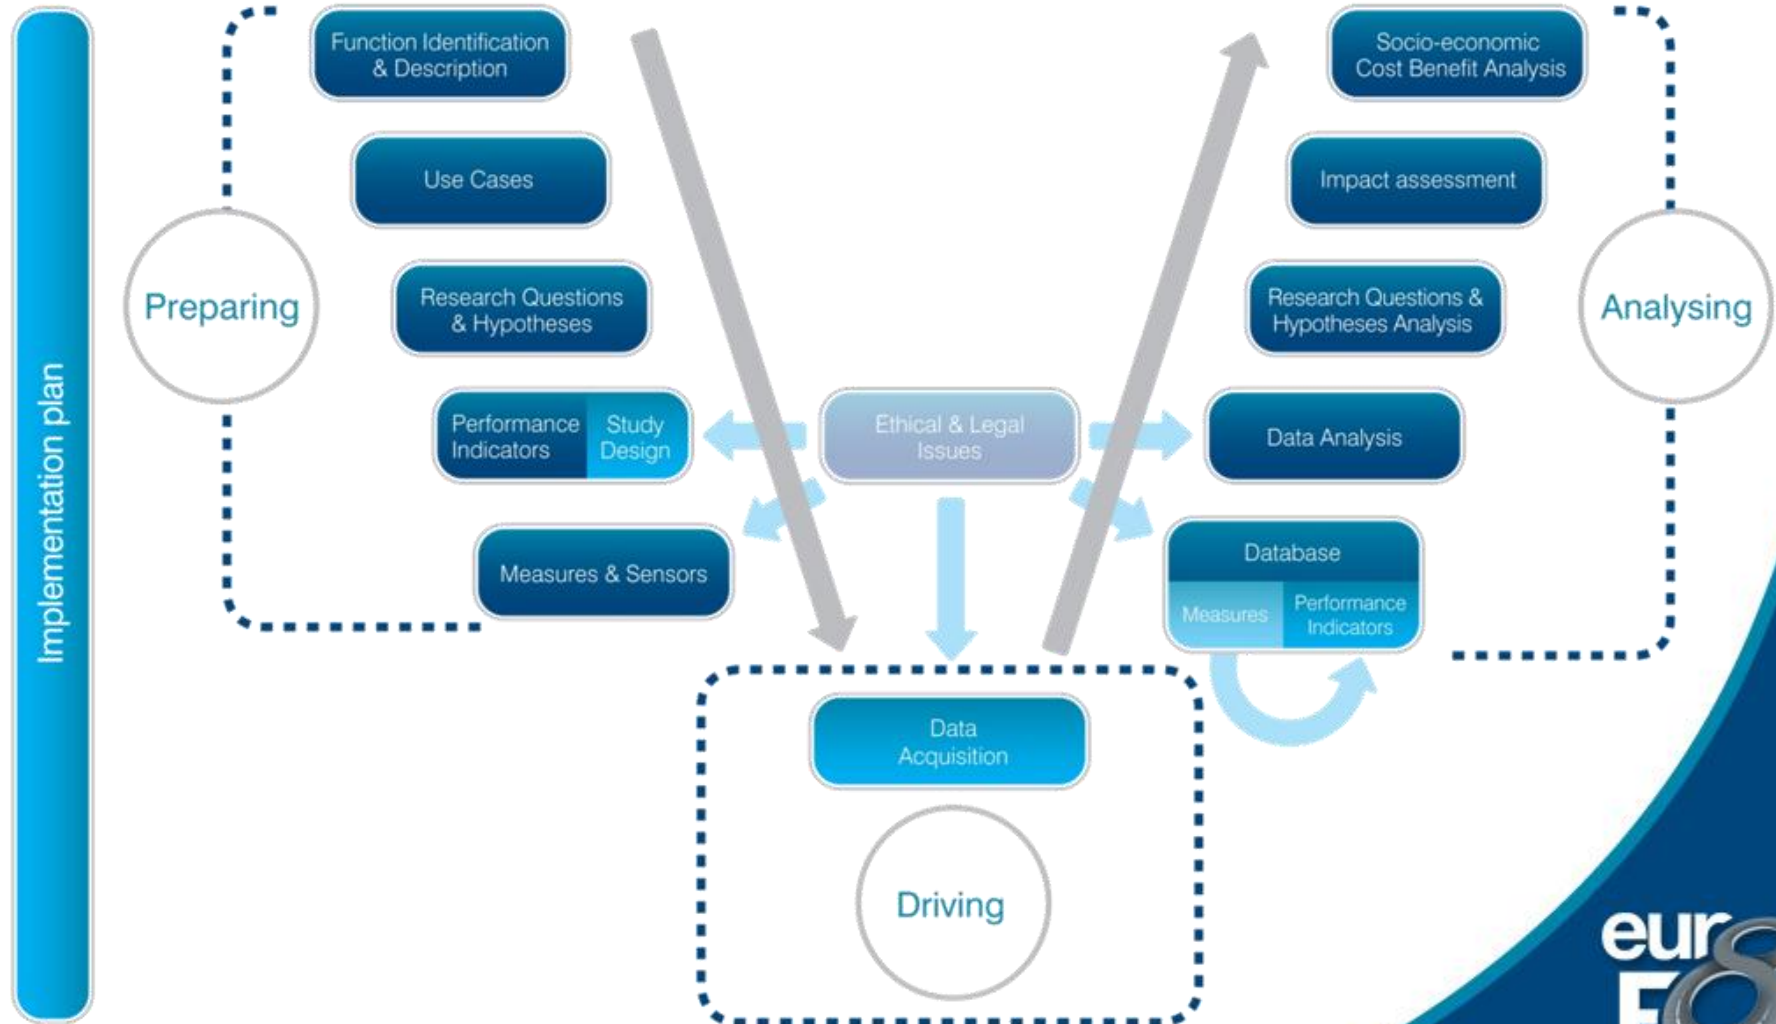

Complexity of FOT

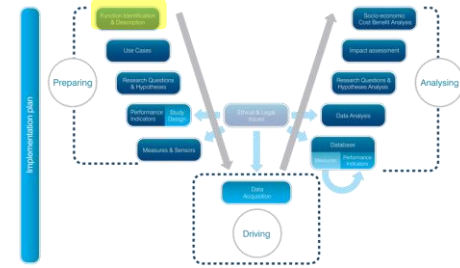

Volvo IVI FOT

Approach – FESTA V

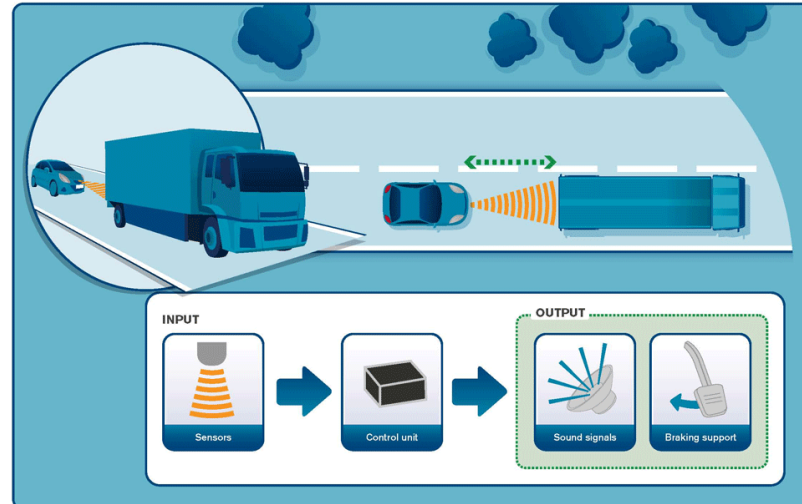

Function Definition: ACC and FCW

ACC Adaptive Cruise Control

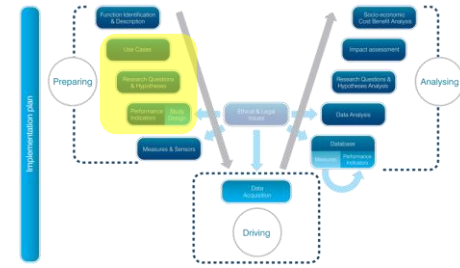

FCW Forward Collision Warning

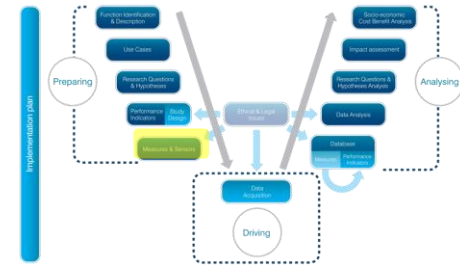

- ⊗ ACC and FCW are integrated in one system
- ⊗ Debundling of effects not always possible
- ⊗ Analysis as a bundle 'ACC and FCW'

RQ, Hypotheses & Performance Indicators

- Research Questions (RQ)
 - General Question on what should be evaluated by means of the FOT
 - Example: Make ACC+FCW road traffic safer?
- Hypotheses
 - Hypotheses are derived from the RQ in order to be able to answer the RQ.
 - Example: ACC+FCW reduces the number of hard braking
- Performance Indicators (PI)
 - “PIs are quantitative or qualitative measurements, agreed on beforehand, expressed as a percentage, index, rate or other value, which is monitored at regular or irregular intervals and can be compared with one or more criteria.” (FESTA Handbook)
 - Example: Max. Deceleration or number of hard braking events

Data collection: Measures & Sensors

- There are different types of data, which can be logged during FOT
 - Questionnaires (Questionnaires at different time points)
 - Signal logging (e.g. from CAN-Bus, GPS, external sensors)
 - Video data (e.g. front camera, driver camera)
- Different data types can be classified by
 - Provided information (content as well as amount)
 - Necessary logging equipment
 - Handling of data transmission
 - Required effort for evaluation

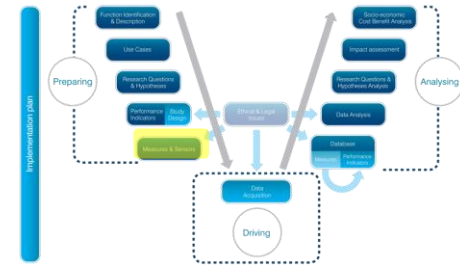

Data collection: Measures & Sensors

- Standard with vehicle
- Mandatory part of the instrumentation (data)
- Optional part of the instrumentation

- Combinations of the data types are possible

Data collection: Measures & Sensors

	Questionnaire	Signal logging	Video data
Type of data	Subjective data	Objective data	(Objective) data
Data amount	-	o	+
Effort for data logging	+	o	-
Effort for data transmission	o	+ (depends on implementation)	-
Evaluation effort	+	o	-

- Combinations of the data types are possible

Data collection

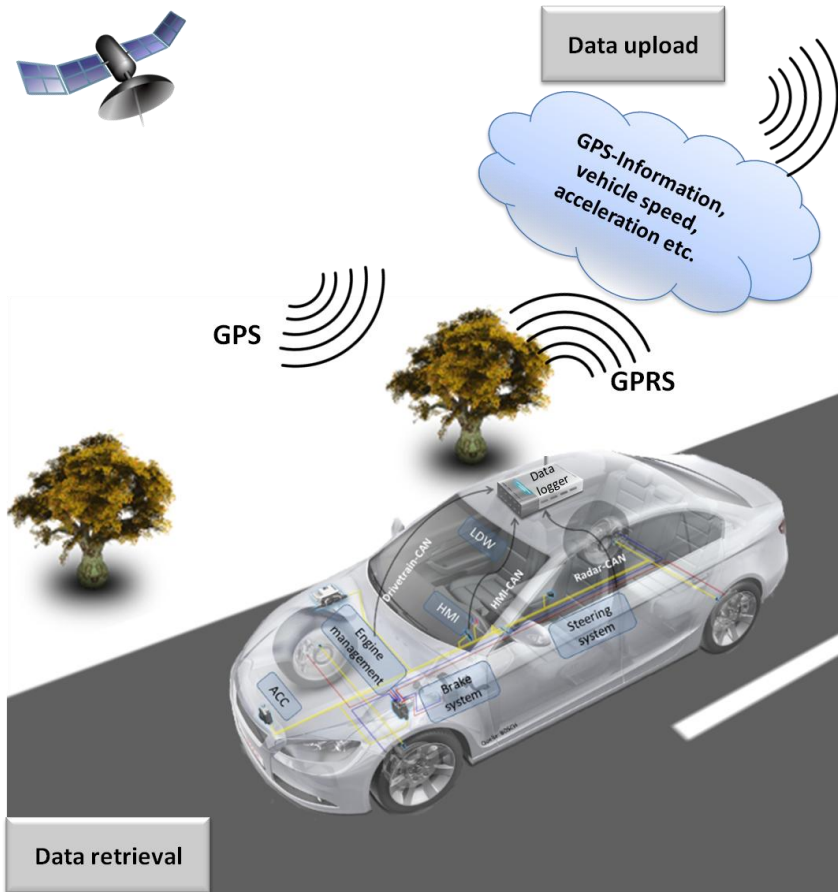

German 1 VMC

- Due to the high number of cars the aim was that the whole process runs autonomously without any interaction of the driver
- Data Sources at the German 1 VMC:
 - CAN-Data as well as GPS-data were logged
 - questionnaires
- Therefore all customer vehicles were equipped with a data acquisition system (DAS), which enables recording of all relevant signals
 - DAS is a small and compact unit that can easily be integrated in the vehicle without modifications on the customer vehicles
- DAS is equipped with a GPRS module
 - Wireless upload of collected data to centralised server

Data collection

- Collection of around 110 vehicle signals from CAN-Bus
- Process of data upload and processing is designed to work fully autonomously
- No driver interaction required

Data collection

If you are going for autonomous approach, monitoring is a crucial point!

Data processing

Data Analysis: Detection of relevant events

Data Analysis: Detection of relevant events

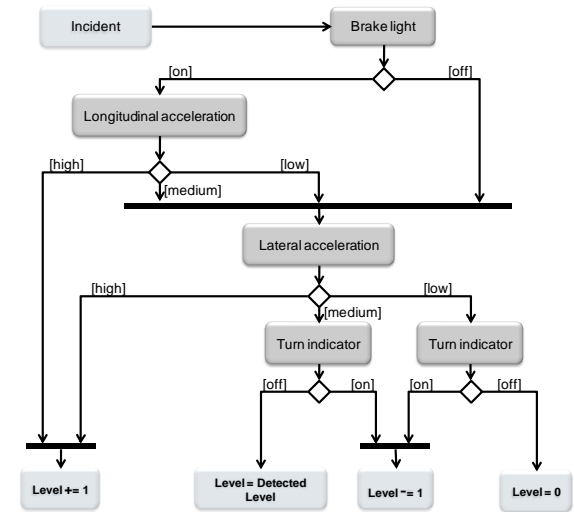

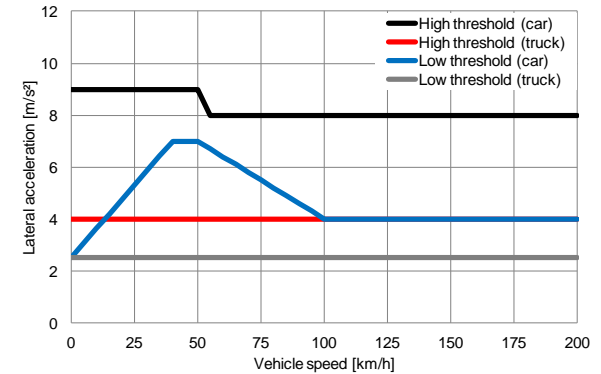

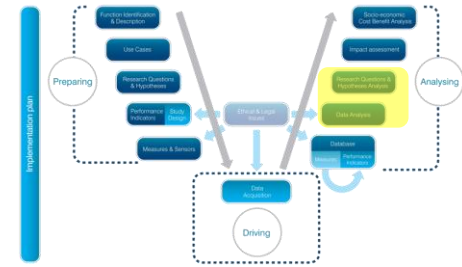

Reduction of false detection rate from 75 % to 5 %

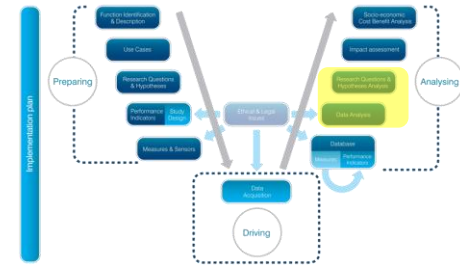

Data Analysis

Example: Incident

- Incidents are critical driving situations, which are used as indicator for traffic safety, since the number of recorded number of accident is too low for statistical analysis.
- Two kinds of incidents
 - Incidents due to vehicle dynamics (Identified by means of lateral / longitudinal acceleration, Yaw rate, ESP and ABS)
 - Incidents due to distance behaviour and driver reaction (Identified by means of the vehicle speed, time-headway (THW), time-to-collision (TTC), relative speed and the state of the brake light)
 - Consider the reaction of the driver in order to overcome the lack of information

Processed data at German1-VMC

	Mileage [km]	Number of drivers	Number of trips	Data amount
Raw data	3.000.000	189	214.469	1046 GB
Data processing	2.500.000	189	170.000	2565 GB
Impact assessment				
<i>Baseline</i>	643.912	118	9.007	212 GB
<i>Treatment</i>	973.653	118	27.237	627 GB

Agenda

Truck	motorway	1	0.59	-40.8	30	429.215

FCW warnings

High reduction of FCW warnings in phases with ACC active on motorways:

- 80% reduction when ACC active and FCW on

Overview on results

Incidents

Number of incidents, overall

Number of incidents, good weather

Results of significance tests			Descriptive statistics						Increase/ Reduction
Conditions	Effect	p-value	Baseline			Treatment			
			Mean	25-P.	75-P.	Mean	25-P.	75-P.	
overall	ACC	<0.0001	0.793	0.024	0.738	0.152	0.000	0.172	-80.8%
good weather	ACC	<0.0001	0.769	0.072	0.777	0.206	0.019	0.225	-73.3%
adverse weather	ACC	0.060	0.421	0.000	0.355	0.083	0.000	0.052	-80.4%
dark	ACC	0.002	0.710	0.000	0.775	0.219	0.000	0.128	-69.2%
daylight	ACC	<0.0001	0.869	0.048	0.786	0.167	0.012	0.268	-80.8%

Fuel consumption

Passanger Cars

Trucks

Vehilce Type	Conditions	Baseline	Treatment	% Increase/ Reduction	N	Mileage [km]
		Mean	Mean			
Car	motorway	7.30	7.10	-2.8	163	698.695
Truck	motorway	24.71	24.28	-1.8	23	327.295

Usage ACC

Type of measure	Performance indicator	Results		Relative Increase / Decrease
		First month treatment	Last month treatment	
Objective	Percentage of travel time travelled with active ACC	19 %	25 %	+31 %
Objective	Number of ACC activations per hour travelled	1.1	1.6	+53 %
Objective	Number of overriding per hour travelled with active ACC	29.2	26.2	-10 %
Subjective (Questionnaire)	Change of user practices in using the ACC	-	63 % (no change)	-

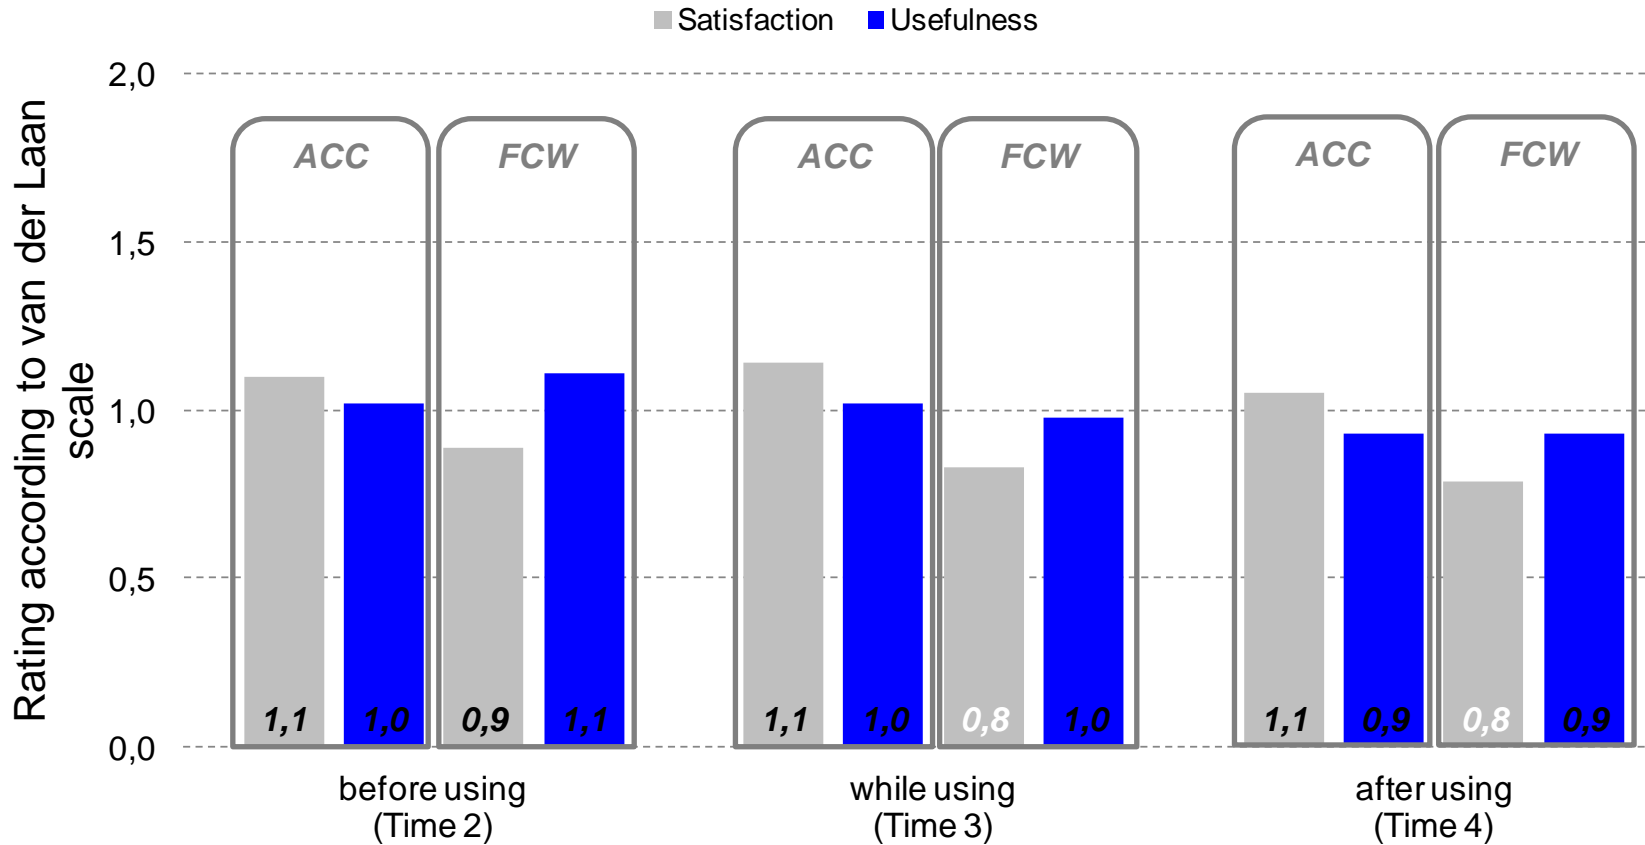

- Drivers use ACC more often and longer over time
- Slight decrease of overriding the ACC (not significant)
- Drivers report no change of ACC usage

Rating of acceptance indicators

- Acceptance rating positive for ACC and FCW
- Van der Laan scale ranges from -2 to +2

Acceptance - change over time

- No significant changes over time for ACC and FCW
- Acceptance rating of ACC and FCW is very positive

Perceived driving comfort and safety

ACC leads to an increase of perceived driving safety and perceived driving comfort:

- 94% of drivers feel that ACC increases safety
- 77% of drivers feel that ACC increases comfort

Conclusion for ACC

- Acceptance in terms of perceived usefulness and satisfaction is high (stable over time)
- Driver expectations were fulfilled
- More than 75% of the driver feel that driving comfort and safety increases
- ACC perceived to be most useful on motorways
- ACC has a positive influence on driver behaviour (increased THW), which leads to increased safety
- Fuel consumption is reduced when driving with ACC

Conclusion for FCW

- Almost 70% of drivers feel that FCW increases safety
- High expectations of drivers are mostly fulfilled
- Acceptance (usefulness, satisfaction) is high and stable over time
- FCW is perceived to be most useful on motorways
- Drivers were not all positive to the audio-visual warning
